

Advice safe use fungicide coated seed

With the use of fungicide coated seed you must observe precautions for your own safety and the protection of the environment. On this page you find more information about these precautions.

In general

Do not use fungicide coated seed for human or animal consumption or for processing. Keep out of reach of children, livestock and wildlife. Handle seed packages carefully. Avoid contact with skin and respiratory tract and wear suitable protective equipment during seed handling and equipment cleaning. Wash hands and exposed skin before meals and after work. Remove any seed spillages. Keep coated seed away from surface water.

Before sowing

When opening seed packages and during, filling or emptying of the drilling machine, avoid dust exposure. Avoid transfer of dust from the seed package into the sowing machine. Do not treat the previously fungicide coated seed with additional products.

At sowing outdoors

When using a pneumatic drilling machine, dust from coated seed should be directed to the soil surface or into the soil through deflectors. Sow at the recommended seeding rate. To protect birds and mammals, fungicide coated seed must be covered by soil, also at row ends.

After sowing

Do not leave empty seed packages or left-over coated seed in the environment. Dispose of them according to local legislation. Ensure that left over coated seed is returned to their original seed packages and do not use empty seed packages for other purposes.

Do not use for human or animal consumption

Wash hands

Keep out of reach of children, livestock and wildlife

Do not contaminate surface water or ditches

Wear suitable protective equipment

Minimize dust generated at drilling
